

Triage Master
Assignment 5:

Ho-nam Leung, Joshua Yourth, Rachel Foo

Triage Master is a hospital timed simulation game for one player which is you, the nurse of this hospital who must beat the timer before things go south.

As a triage nurse at Angelvale hospital it is your job to give patients the right treatment they need. These patients depend on you to treat them quickly before they pass. Move patients from the waiting room to their appropriate rooms and give them the right medicine before it's too late.

The game is designed on Godot. Press the start button on the title page to start the game.

Description

The aim of the game is to treat as many patients as you can before your shift ends, but you must treat them before they die.

Win criteria: Survive the whole shift with less than 3 patients dying.

Lose criteria: 3 patients died

Controls

Keyboard:

- Movement: WASD / arrow keys
- Interact: F / Space
- Sprint: shift (hold)
- Restart game: r
- Instructions : tab

Controllers: (x-box controller standard)

- Movement: left stick
- Interact: B, X
- Sprint: A (hold)
- Restart game: start button
- Instructions : Y

- Pick up patients by interacting with them while facing them
- Put down patients by interacting while holding patient
- Place patients on bed by interacting with the bed while holding a patient
- Apply medicine to on-bed patient by interacting with the bed while holding the corresponding medicine
- Extract healed patients by putting them down in exit area

How to Play

Heal Patients:

- Put patients on their corresponding bed (or icu bed)

Bed types:

- Light beds (located on the left)
- Moderate beds (located top right)
- Severe beds (located bottom right)
- ICU (located in the middle)
 - Any patient can be placed in ICU and healing process starts without the need for medicine
- Apply corresponding medicine to the on-bed patients to start the healing process
- When healing process starts, patient's death timer will stop

Extract Patients:

- Put healed patients at the exit area to allow them to leave

Aim:

- Treat and extract as many patients as you can during your shift
- Don't let them die
 - Patients die when the skull above their head is complete

Game Loop

- About every 5 seconds a new patient will spawn in the waiting room (located at the bottom left of the screen)

Each time a patient spawns, their injuries will be randomized from the following:

- Light injuries (green)
- Moderate injuries (yellow)
- Severe injuries (red)

- Each patient has a death timer when spawn (skull above their head)
 - If the skull is complete, they will die
- Your shift timer decreases as time passes (located bottom center)
- When you **extract** a patient, the patients healed counter will increase (located bottom left)
